

How Print Pricing Works

A plain-language guide to the price suggestions in the New/Edit Print form — what they're based on, how they're calculated, and how to use them.

When you're adding a new print or a new size to an existing one, the dashboard now suggests a price for you. You never have to accept it — it's a starting point you can type over any time — but it's built to save you the guesswork, especially for sizes you don't sell often.

The short version: you type one price — for the A4 size — and tell it how many prints are in the edition. Everything else is worked out from those two numbers.

01 Two things decide the price

Every suggested price comes from just two ingredients: how big the print is, and how limited the edition is.

Size. A bigger print costs more — that part's obvious. The question is how much more, and that's answered by looking at your one real, already-selling print, *The Herdsman*. Its A3 sells for roughly twice its A4, its A2 for over three times, and its A1 for close to seven times. The dashboard uses those same ratios for every print you add, so a new print's sizes stay priced the way your existing print already is.

Edition size. A print that's part of a small, tightly limited edition is worth more per copy than one from a large or open edition — that's just how limited-edition art pricing works everywhere. The fewer copies that will ever exist, the more each one is worth.

02 Size: what each size costs relative to A4

These ratios are fixed — they don't change from print to print. Whatever you set your A4 price to, the rest follow automatically.

SIZE	COMPARED TO A4	BASED ON
A4	— (this is the one you set)	Your starting price
A3	≈ 1.95×	The Herdsman's real pricing
A2	≈ 3.35×	The Herdsman's real pricing
A1	≈ 6.65×	The Herdsman's real pricing

03 Edition size: how scarcity changes the price

An edition of 10 is the baseline — that's what *The Herdsman* is, so a new print with the same edition size prices identically to it. Tighter editions cost more per print; larger or open editions cost less. The scale-up isn't a straight line (an edition of 5 doesn't simply cost double an edition of 10) — it eases off gradually, the way real gallery pricing tends to.

EDITION SIZE	PRICE MULTIPLIER	IN PLAIN TERMS
1 (unique piece)	2.0×	The most expensive tier — nothing scarcer
5	≈ 1.4×	Noticeably more than the baseline
10	1.0×	The baseline — same as The Herdsman
20	≈ 0.7×	Meaningfully cheaper per print
50 or more	0.5×	The lowest tier
Open / unlimited edition	0.5×	Priced like a very large edition

04 Worked examples

Here's the same A4 price — GHS 2,000 — run through four different edition sizes, so you can see how much the edition alone moves the rest of the prices.

Edition of 10 — the baseline

A4 = GHS 2,000 · same edition size as The Herdsman

A4 2,000	A3 3,900	A2 6,700	A1 13,300	A0 24,000
-------------	-------------	-------------	--------------	--------------

Edition of 5 — tighter, so pricier

A4 = GHS 2,000 · 1.4× the baseline

A4 2,000	A3 5,520	A2 9,480	A1 18,810	A0 33,940
-------------	-------------	-------------	--------------	--------------

Edition of 25 — looser, so cheaper

A4 = GHS 2,000 · about 0.63× the baseline

A4 2,000	A3 2,470	A2 4,240	A1 8,410	A0 15,180
-------------	-------------	-------------	-------------	--------------

Open edition

A4 = GHS 2,000 · priced at the lowest tier

A4 2,000	A3 1,950	A2 3,350	A1 6,650	A0 12,000
-------------	-------------	-------------	-------------	--------------

Note: A4 is always exactly what you type — it's the one number the whole suggestion is built from, not something the tool calculates for you. Every price above is rounded to the nearest GHS 10.

05 How to use it in the dashboard

1 Open New Print (or Edit Print).

Content Manager → Prints → New Print.

2 Check the box for A4 and type its price.

This is the one price you always set by hand — everything else is worked out from it.

3 Fill in the edition field.

Just the number is fine ("10", "5"), or "open" for an unlimited edition.

4 Check the other sizes you're offering.

A suggested price appears in each one automatically, based on the table on the previous page.

5 Type over any number you don't agree with.

The moment you type into a price field yourself, that field is yours — the tool will never quietly change it again.

One thing to know: when you open a print that already has saved prices, those prices are left alone — the tool only fills in blanks. So changing the A4 price on an existing print won't recalculate its other sizes; those stay exactly as you last set them, on purpose.
