

Print Pricing — Sample Prices

Worked examples showing exactly how the suggested prices are calculated.

Suggested price = A4 price × size multiplier × edition multiplier

SIZE MULTIPLIER		EDITION MULTIPLIER	
SIZE	×	EDITION SIZE	×
A4	1.000	1	2.00
A3	1.944	5	1.41
A2	3.333	10	1.00
A1	6.667	20	0.71
A0	13.333	50+ / open	0.50

THE HERDSMAN ITSELF — A4 = 1,980, EDITION OF 10

Edition multiplier = 1.00 — this is the reference print, so the math lands on its real prices exactly

A4	— the price you set	1,980
A3	$1,980 \times 1.944 \times 1.00 = 3,850$	3,850
A2	$1,980 \times 3.333 \times 1.00 = 6,600$	6,600
A1	$1,980 \times 6.667 \times 1.00 = 13,200$	13,200
A0	$1,980 \times 13.333 \times 1.00 = 26,400$	26,400

A3, A2 and A1 match The Herdsman's real, already-selling prices exactly — GHS 3,850 / 6,600 / 13,200. A0 isn't a real size yet, so it continues the same doubling The Herdsman's own numbers already show from A2 to A1.

SAME LOGIC, A DIFFERENT PRINT — A4 = 1,980, EDITION OF 5

Edition multiplier = 1.414 (a tighter edition costs more)

A4	— the price you set	1,980
A3	$1,980 \times 1.944 \times 1.414 = 5,445$	5,440
A2	$1,980 \times 3.333 \times 1.414 = 9,334$	9,330
A1	$1,980 \times 6.667 \times 1.414 = 18,668$	18,670
A0	$1,980 \times 13.333 \times 1.414 = 37,335$	37,340

Every result is rounded to the nearest GHS 10. A4 is always the number you type in — it's never calculated for you.
